

Looping Statements in Java

1. **for loop**: Best when the number of iterations is known in advance.
2. **while loop**: Useful when the number of iterations is unknown and the loop continues as long as the condition is true.
3. **do-while loop**: Similar to the **while** loop, but guarantees the code block executes at least once.
4. **Enhanced for loop**: Simplifies iterating over arrays or collections.
5. **break** : Exits the loop prematurely.
6. **continue** : Skips the current iteration and moves to the next one.

Loops are fundamental in programming and are used for repetitive tasks, iteration over data, and more.
